

Contract: Project outside course scope "Advanced Condensed Matter Theory"

Personal information of the student

Ucph username:	
First Name:	
Surname:	
Email:	
Telephone number:	
Study Programme:	
Specialization (if applicable):	

Information about the main supervisor

Name:	Michele Burrello
Email:	michele.burrello@nbi.ku.dk
Institute:	The Niels Bohr Institute

Information about the project period

The project counts for:

☐ *Restrictive elective* ☐ *Elective*

Remarks:

- The project may count as "Restrictive elective" for the specialization "Quantum Physics": in this case, you must file a dispensation request by sending this project to studentservices@science.ku.dk.
- The course is also relevant for PhD students.

Project workload (ECTS)	Period:	Deadline for the submission of the project report:
7.5 credits	Block 4	23/06/2022

Exam

Type of assessment

Continuous assessment

Written assignments

The evaluation is based on the following homework assignments:

- Problems sets (counting for 50% of the final grade)
- Final report (counting for 50% of the final grade)

Exam registration requirements

80% attendance

Marking scale

7-point grading scale

Censorship form

No external censorship

One internal examiner plus one internal censor.

Re-exam

New final report and oral exam.

If a student fails to qualify for the exam due to lack of attendance, he/she may qualify for the re-exam by orally presenting his/her solutions of a problem set to the instructor, working through the solutions on the board.

Title of the project

Study group on "Advanced condensed matter theory"

Content

In this study project, we will cover selected topics in condensed matter theory and quantum many-body physics at an advanced and in-depth level. The following is a tentative list of topics:

- Renormalization group for condensed matter systems
- 1D interacting models, Luttinger liquids and bosonization
- Overview of the Sine-Gordon model and the BKT phase transition
- Quantum phase transitions and the Ising model
- Majorana modes and topological superconductors
- Topological order and the toric code
- Anyons and topological quantum computation

There are two **main objectives** for this study group:

1. To complete the preparation of the students interested in pursuing research in the theory of condensed matter, quantum many-body and statistical physics.
2. To bring students closer to the research activities in this area, by working on selected topics of their choice in the recent literature.

The study project will adopt the operator description of many-body physics taught in Advanced Quantum Mechanics and Condensed Matter Theory 1.

The language of field theory will be used as well for some of the topics of this study project. The necessary tools from field theory will be discussed during the study project, based on either the functional path integral taught in Condensed Matter Theory 2 or the quantum field formulation taught in Quantum Field Theory 1.

Learning outcome

Skills

The students will acquire a set of strategies to investigate the physics of complex quantum many-body systems. The study project will indeed present several theoretical techniques to describe the main features of a selection of quantum many-body systems of current interest in the scientific community.

In this respect, the students will be invited to think like researchers and describe complex systems by trying different approaches in their analysis.

The training of the students to this kind of research activity will include getting into a new topic by reading original research papers, learning to identify new questions, and distilling key physical principles at play in complex phenomena. In particular, each student will investigate a specific topic, carrying out detailed calculations and writing a final report on his/her understanding and findings.

Knowledge

At the end of the study project, the student will know the fundamentals of the above listed topics and their connections to other areas of modern physics. The knowledge will be at a level such that the participants will be prepared to follow and conduct research in the given area.

Competences

After this study project the students will be experienced in a method for starting research in a new area. They will be able to extract the needed information from existing literature and to think about new directions for the research area in question.

Literature

To be announced on Absalon.

Recommended Academic Qualifications

The student is expected to have passed courses on mathematics, quantum mechanics and statistical physics on the level covered in the corresponding Bachelors courses in Physics at UCPH.

Knowledge of quantum mechanics on the level taught in "Advanced Quantum Mechanics" at UCPH is required.

Basic knowledge on the main condensed matter physics systems is expected.

Knowledge of quantum field theory or functional path integral is an advantage.

Teaching and learning methods

The study project will present a mixture of lectures, problem sessions and group activities. Several mandatory assignments are foreseen, including exercise sets and a final report on a topic related to the contents of the course chosen by the student.

Workload

CATEGORY	HOURS
Lectures	50
Preparation	113
Theory exercises	10
Project work	24
Guidance	9
TOTAL	206

Feedback form

Written

Oral

Individual

Continuous feedback during the course of the semester.

Written feedback will be given about the final report.
